

D6 UNIT 3-A

PLANNING

Work breakdown structure,
prioritization and task planning

Work breakdown techniques

2

- Allow to know the scope of a project
- Are applied before planning the project

- Types (different degrees of detail and information):
 - Work breakdown structure
 - Workflow diagrams
 - Workflow systems

Work breakdown techniques

3

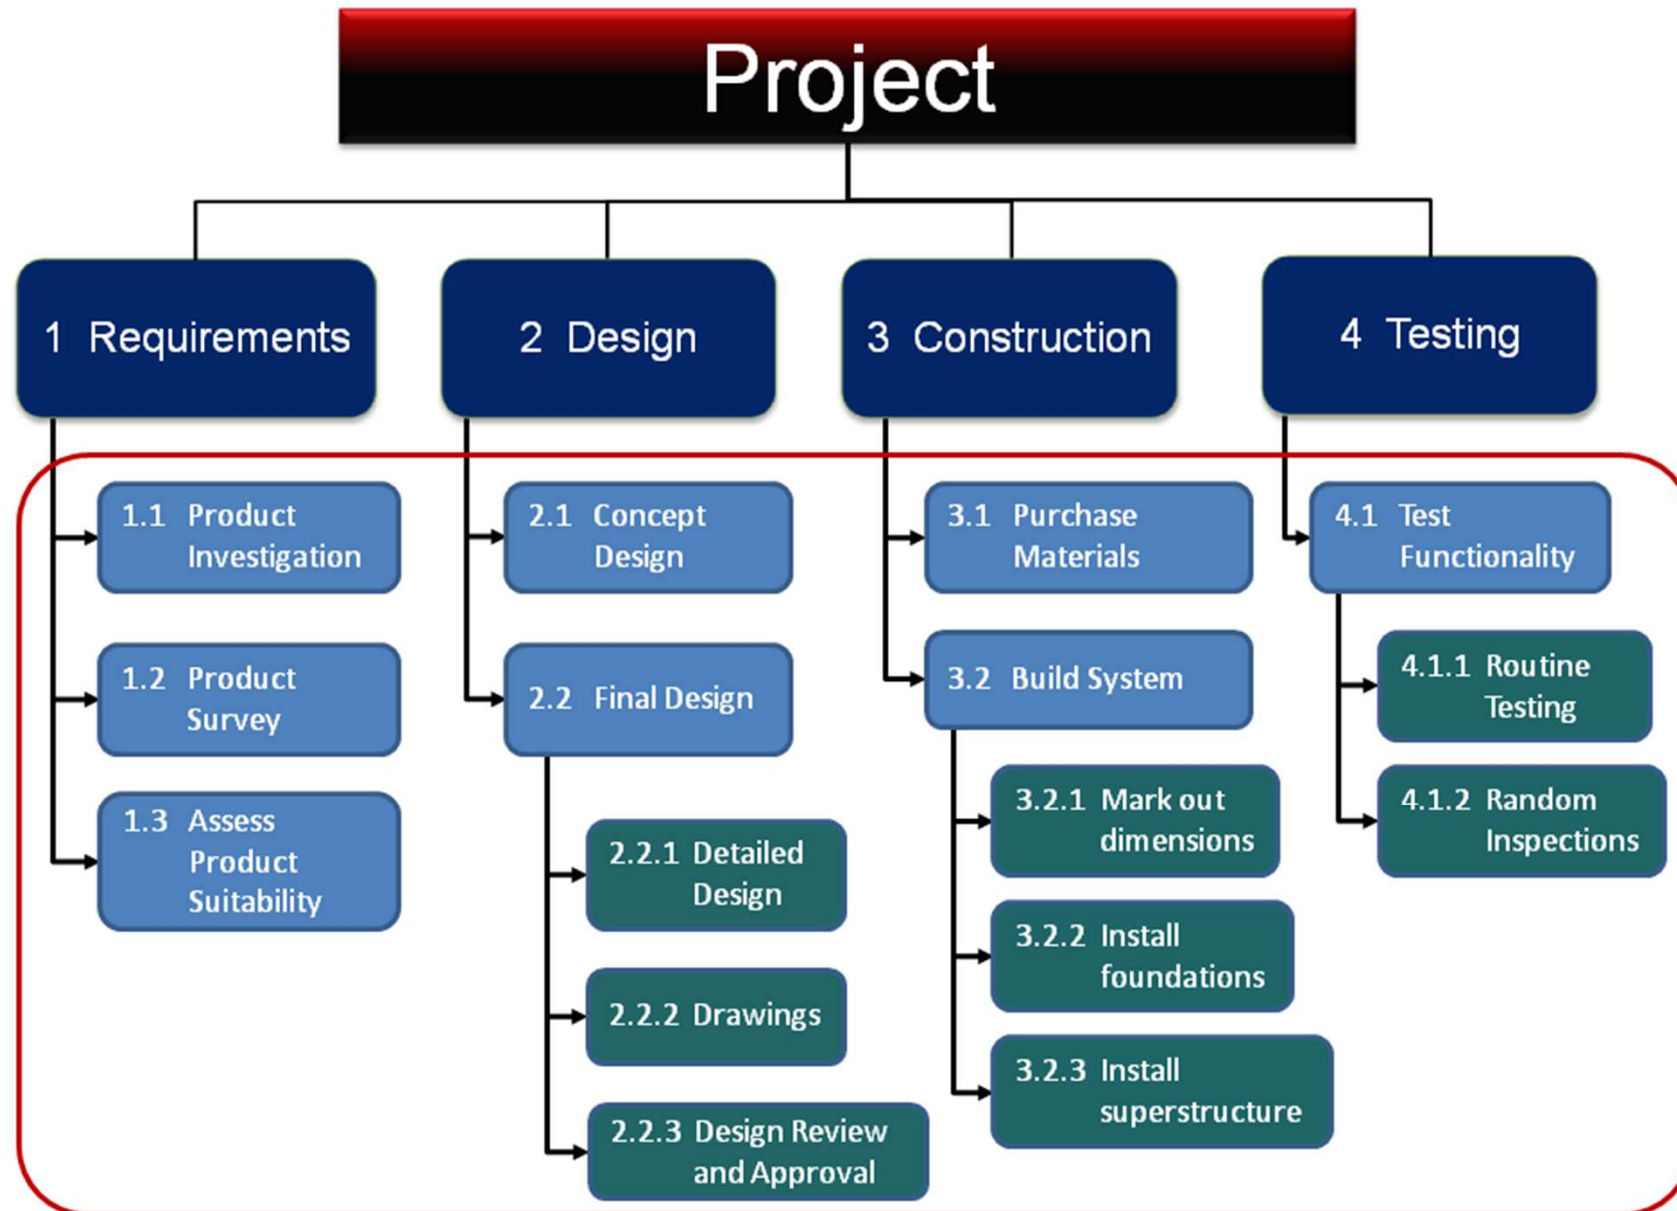

Work Breakdown Structure (WBS)

Estructura de descomposición de trabajos (EDT)

- The main goal is to organize and define the scope of the Project.
- Each level represents an increase in the detail of the description.
- Software projects usually imply at least three levels:
 1. Phases in the life cycle
 2. Standard tasks in each phase
 3. Specific tasks for that Project

Work breakdown techniques

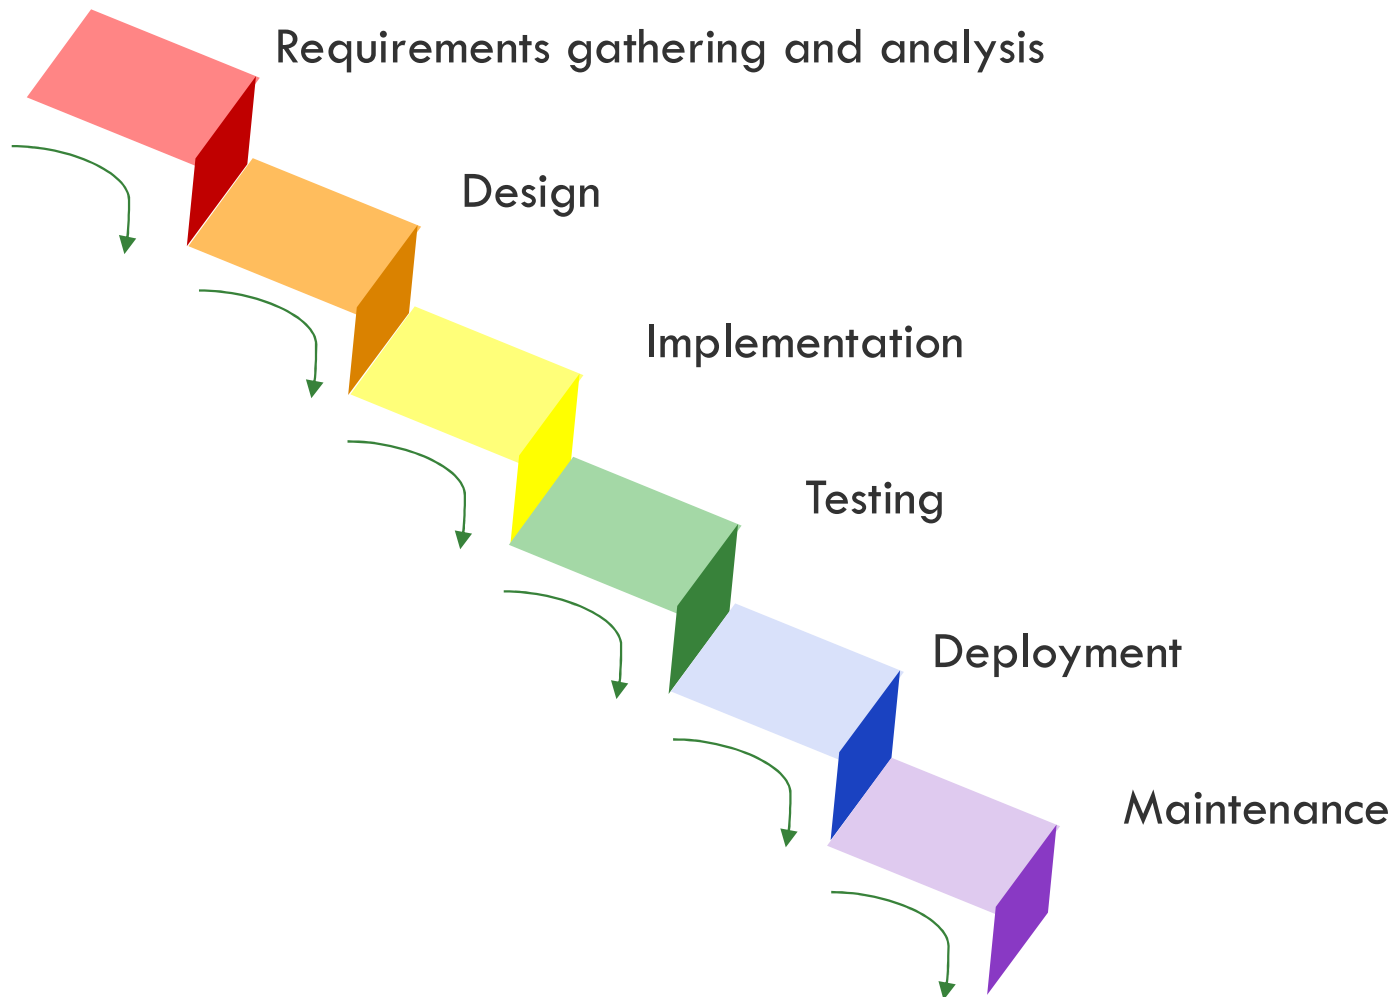

4

Traditional model

Waterfall

5

Traditional model

Waterfall

6

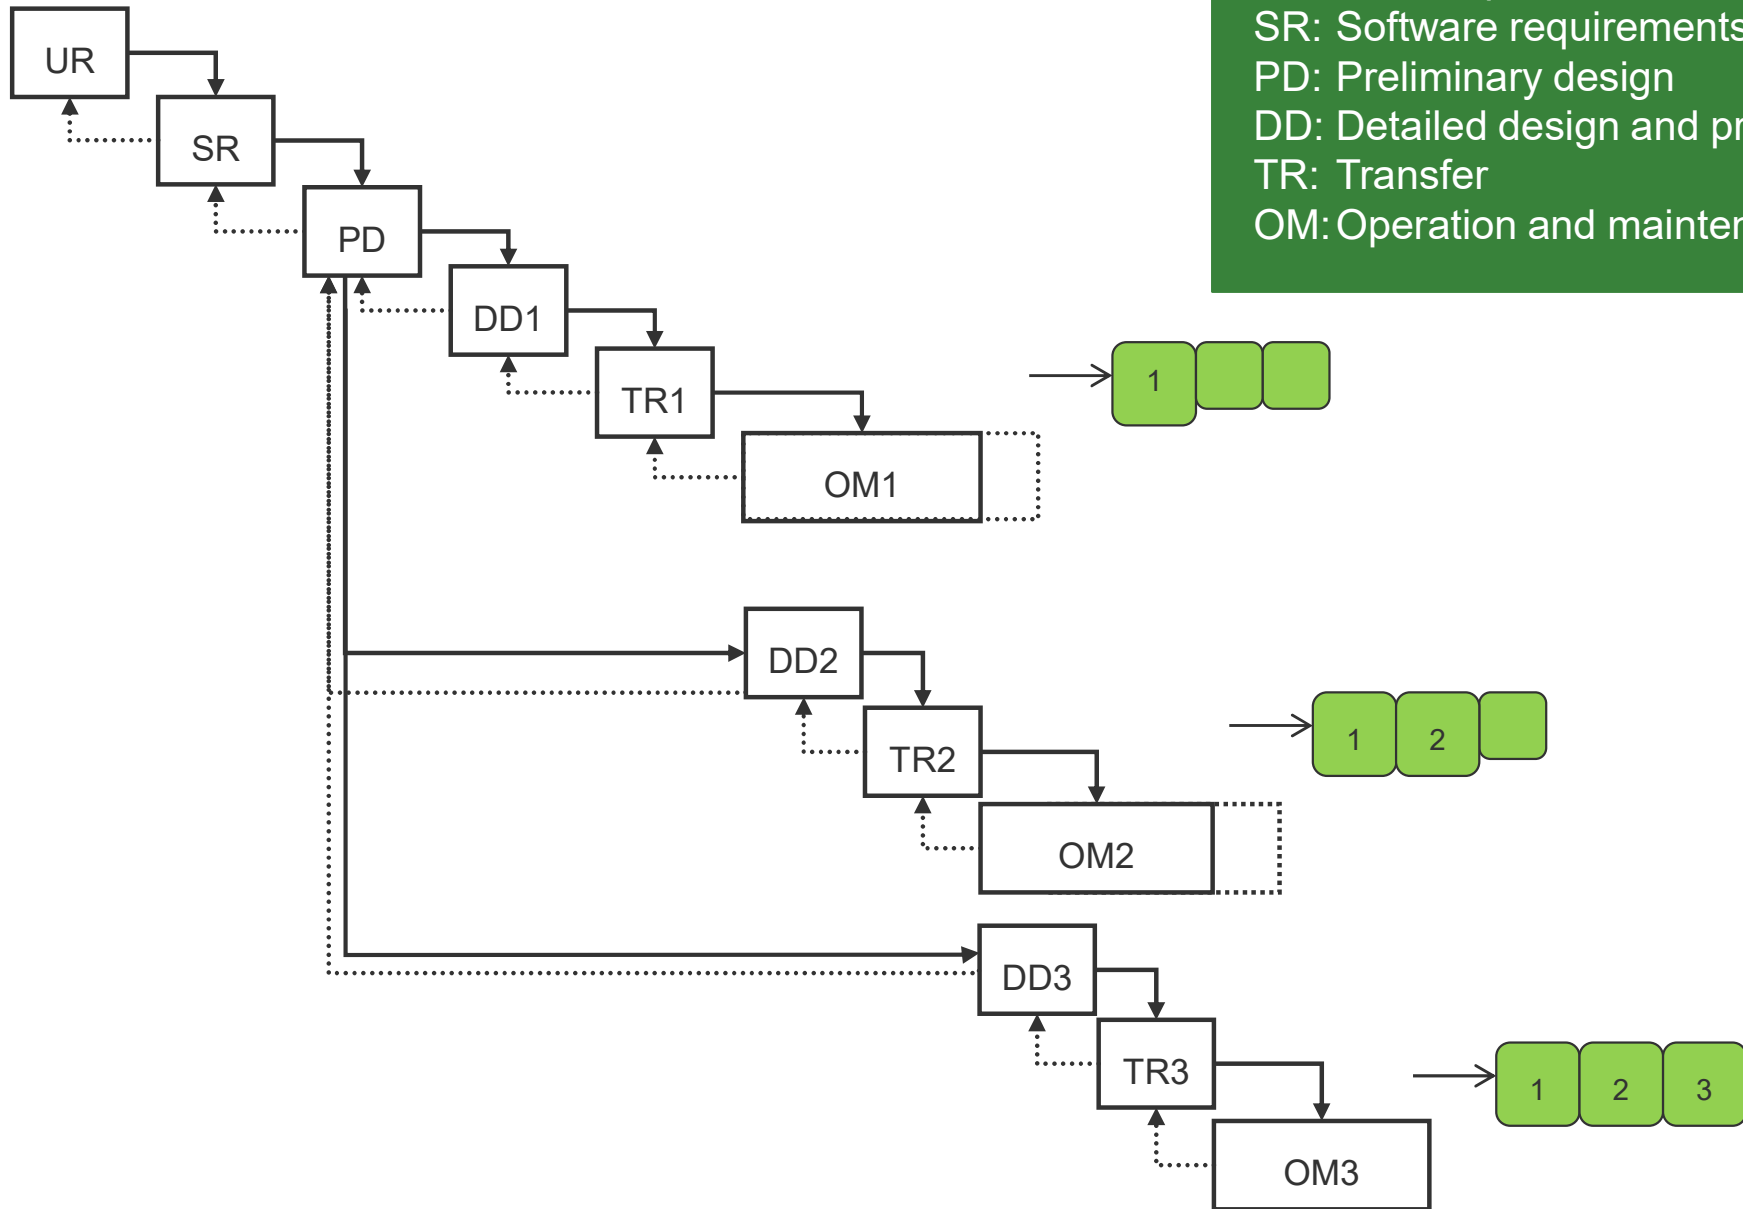

- Clear structure
- Objectives set at the beginning
- Information is well transmitted
- Changes are difficult
- Excludes client or final user
- Tests at the end

14

Life-cycle models

Agile manifest

15

1. Customer satisfaction by **early and continuous delivery** of valuable software.
2. Welcome **changing requirements**, even in late development.
3. **Deliver** working software **frequently** (weeks rather than months).
4. Close, daily **cooperation** between business people and developers.
5. Projects are built around **motivated individuals**, who should be trusted.
6. **Face-to-face conversation** is the best form of communication (co-location).
7. **Working software** is the primary measure of progress.
8. **Sustainable development**, able to maintain a constant pace.
9. Continuous attention to **technical excellence and good design**.
10. **Simplicity**—the art of maximizing the amount of work not done—is essential.
11. Best architectures, requirements, and designs emerge from **self-organizing teams**.
12. Regularly, the **team reflects** on how to become more effective, and adjusts accordingly.

Iterative incremental model

Iterative + Incremental

16

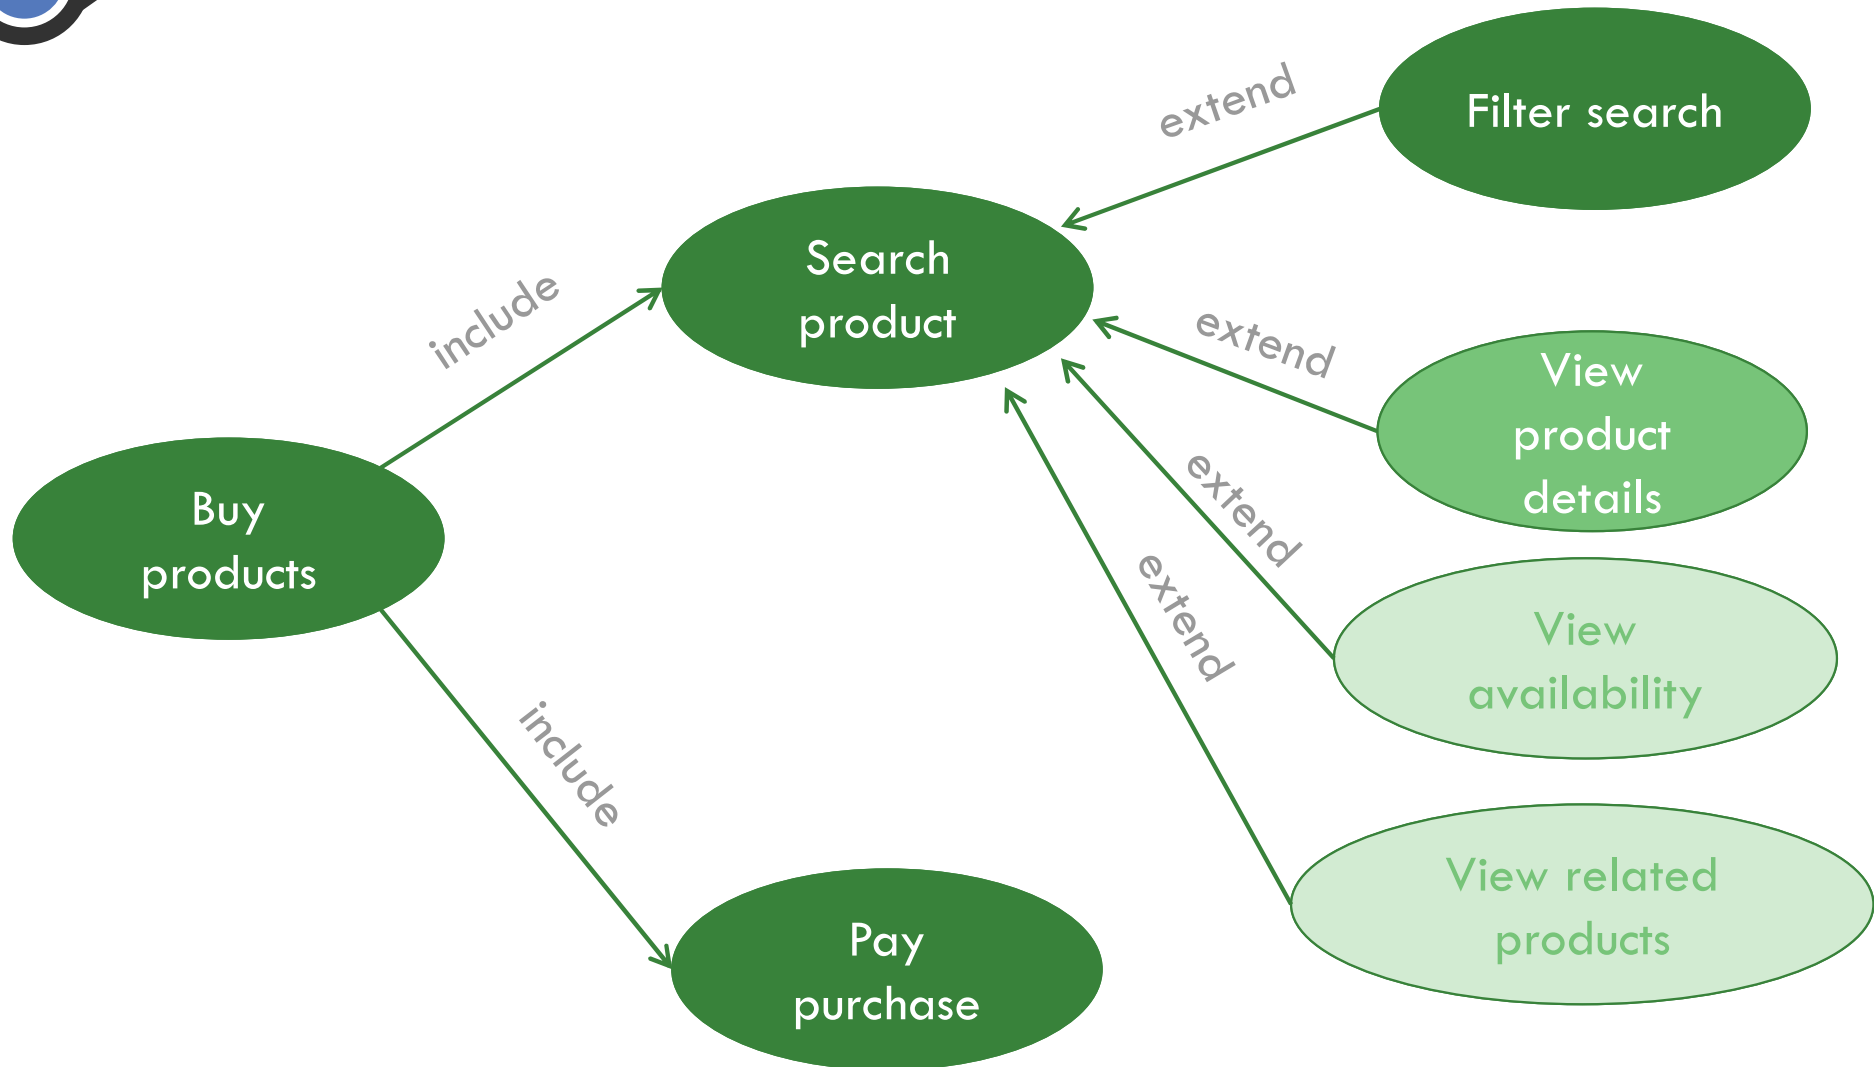

- **Iterative**: In each iteration, a similar work process is repeated (iterations are similar to miniprojects).
- **Incremental**: New options are added in each iteration.

Iterative incremental model

Prioritizing requirements

17

Iterative incremental model

Prioritizing requirements

18

- *A user can search for products in the catalog indicating key words.*
- *A user can add products to the shopping cart, indicating size and amount.*
- *A user can filter the results of a search by category, sport or gender.*
- *A user can see the details of a product, including pictures, uses, materials and technical specifications.*
- *A user can see the availability of a product in the shops near a given address.*
- *A user can pay for the selected products with a credit card.*
- *The system shows those products related to a selected one, including similar and complementary products.*

[illegible]

Example

32

The Release Plan

Steps

33

- Select an iteration length
- Estimate the velocity
- Prioritize the stories
- Allocate stories to the one or more iterations

The Release Plan

Prioritizing user stories

34

- Sort the stories so that they maximize the value delivered to the organization.
- Stories are prioritized by the customer but with input from the developers.

The Release Plan

Prioritizing user stories

35

Dimensions along which we can sort stories:

- the risk that the story cannot be completed as desired (for example, with desired performance characteristics or with a novel algorithm)
- the impact the story will have on other stories if deferred (we don't want to wait until the last iteration to learn that the application is to be three-tiered and multi-threaded)

The Release Plan

Prioritizing user stories

36

Additional factors:

- the desirability of the story to a broad base of users or customers
- the desirability of the story to a small number of important users or customers
- the cohesiveness of the story in relation to other stories (for example, a “zoom out” story may not be high priority on its own but may be treated as such because it is complementary to “zoom in,” which is high priority)

The Release Plan

Prioritizing user stories

37

MoSCoW rules.

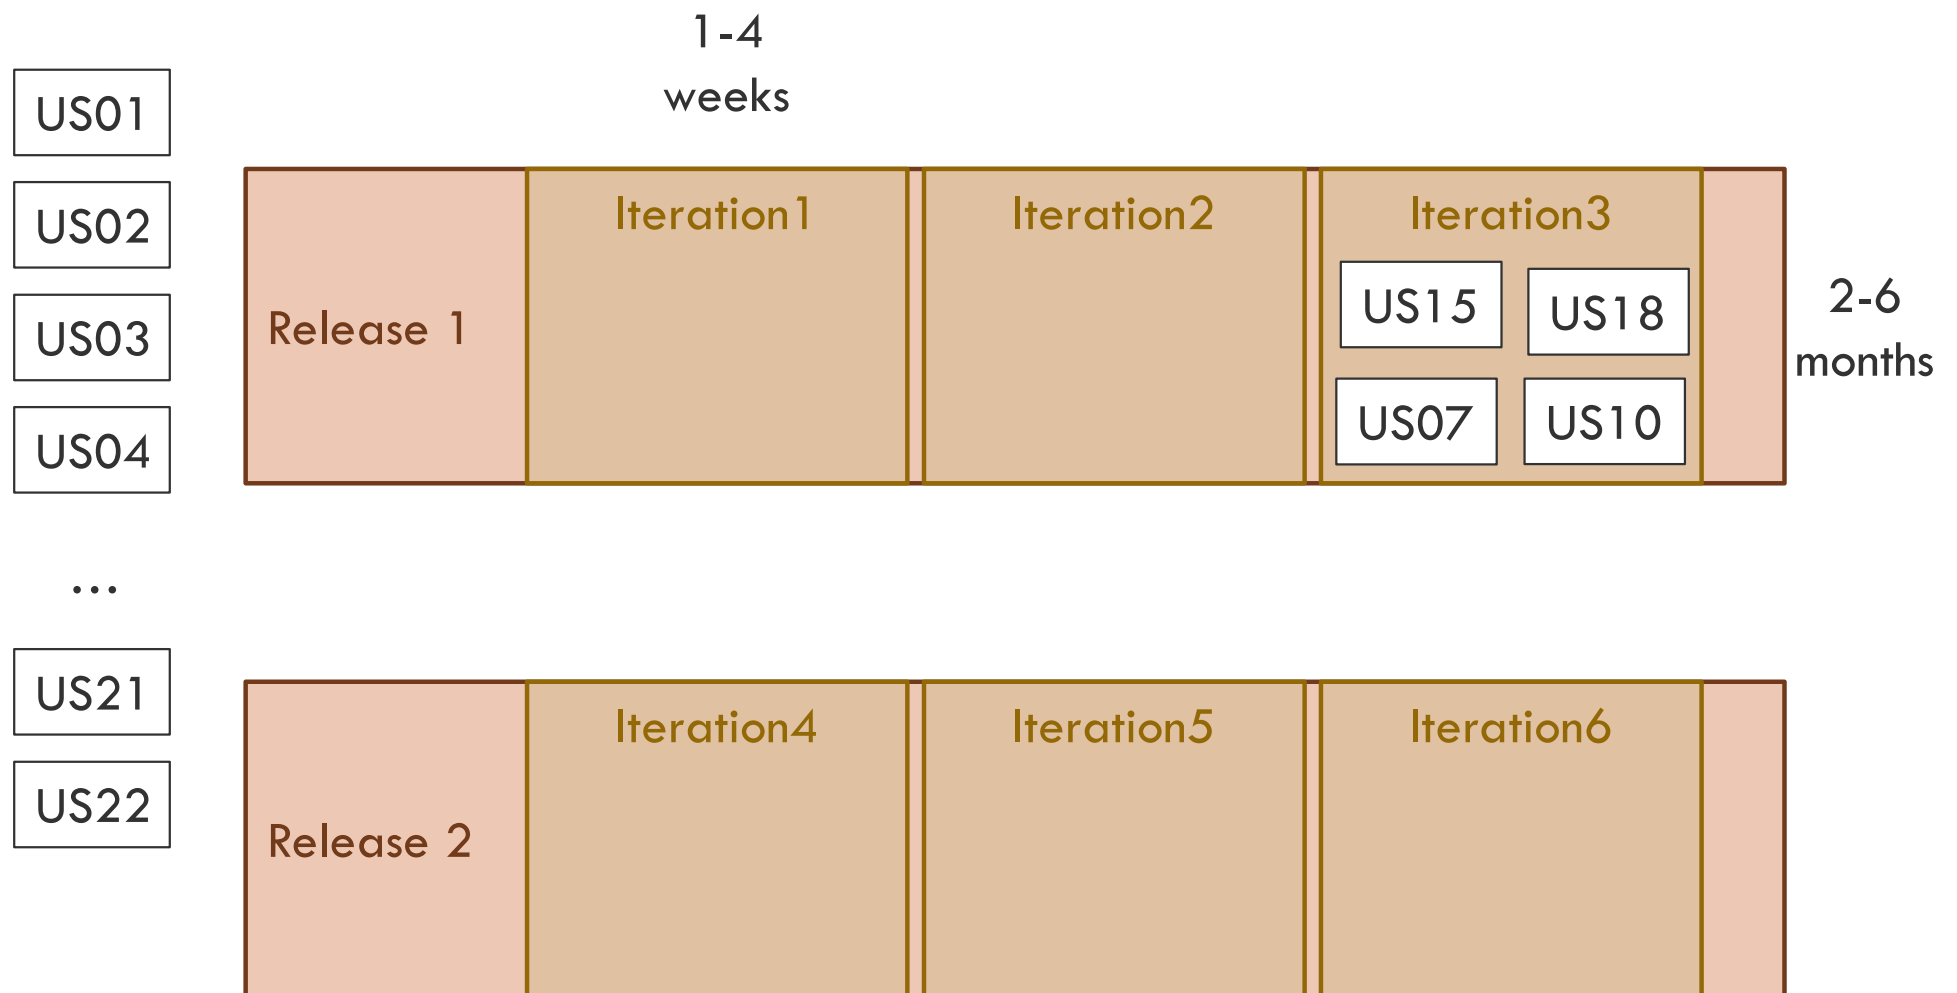

- Must have
- Should have
- Could have
- Won't have this time

The Release Plan

Releases and iterations

38

The Release Plan

Releases and iterations

39

- Releases and iterations are planned by placing stories into iterations.
- Velocity is the amount of work the developers can complete in an iteration.
- The sum of the estimates of the stories placed in an iteration cannot exceed the velocity the developers forecast for that iteration.
- If a story won't fit in an iteration, you can split the story into two or more smaller stories.
- Acceptance tests validate that a story has been developed with the functionality the customer team had in mind when they wrote the story.

The Release Plan

40

Story	Story Points
Story A	3
Story B	5
Story C	5
Story D	3
Story E	1
Story F	8
Story G	5
Story H	5
Story I	5
Story J	2

The team estimates a velocity of thirteen story points per iteration (assume decreasing priority)

Iteration	Stories	Story Points
Iteration 1	A, B, C	13
Iteration 2	D, E, F	12
Iteration 3	G, H, J	12
Iteration 4	I	5

What if we can split I into Y(3) and Z(2)?

Iteration	Stories	Story Points
Iteration 1	A, B, C	13
Iteration 2	D, E, F	12
Iteration 3	G, H, Y	13
Iteration 4	J, Z	4

Planning a release

41

- What are three ways of estimating a team's initial velocity?
 - Historical values
 - Take a guess
 - Run an initial iteration and use the velocity of that iteration

Planning an iteration

42

- Iteration planning takes release planning one step further but only for the iteration being started.
- To plan the iteration, the team discusses each story and disaggregates it into its constituent tasks.
- There is no mandatory size range for tasks (for example, three to five hours). Instead, stories are disaggregated into tasks to facilitate estimation or to encourage more than one developer to work on various parts of the story.
- Developers accept responsibility for the tasks.
- Developers assess whether they have over-committed themselves by estimating each task they have accepted.

Planning an iteration

Decomposing a story into tasks

43

“A user can view detailed information about a hotel.”

- Design the look of these web pages.
- Code the HTML to display hotel and room photos.
- Code the HTML to display a map showing where the hotel is.
- Code the HTML to display a list of hotel amenities and services.
- Figure out how we're generating maps.
- Write SQL to retrieve information from the database.
- Document new functionality in help system and user's guide

Planning an iteration

Decomposing a story into tasks

44

“A user can search for a hotel on various fields”

Task	Who	Estimate
Code basic search screen	Susan	6
Code advanced search screen	Susan	8
Code results screen	Jay	6
Write and tune SQL to query the database for basic searches	Susan	4
Write and tune SQL to query the database for advanced searches	Susan	8
Document new functionality in help system and user's guide	Shannon	2

Monitoring Expected and actual velocities

45

Monitoring

Evolution of story points

46

	Iteration 1	Iteration 2	Iteration 3	Iteration 4
Story points at start of iteration	130	113	78	31
Completed during iteration	45	47	48	31
Changed estimates	10	4	-3	
Story points from new stories	18	8	4	
Story points at end of iteration	113	78	31	0

Monitoring Burndown charts

47

Monitoring

Daily burndown charts

48

Monitoring

49

- A story estimated at **one story point** actually took **two days** to complete. How much does it contribute to velocity when calculated at the end of the iteration?

Monitoring

What is the velocity of this team?

50

Table 11.3 *Stories completed during an iteration.*

Story	Story Points	Status
Story 1	4	Finished
Story 2	3	Finished
Story 3	5	Finished
Story 4	3	Half finished
Story 5	2	Finished
Story 6	4	Not started
Story 7	2	Finished
Velocity	23 ?	16

Monitoring

Complete the table

51

	Iteration 1	Iteration 2	Iteration 3
Story points at start of iteration	100	76	34
Completed during iteration	35	40	36
Changed estimates	5	-5	0
Story points from new stories	6	3	2
Story points at end of iteration	76	34	0

Example

Online bookshop

52

Example

User stories

53

A user can do a basic simple search that searches for a word or phrase in both the author and title fields.	1	Must have
A user can search for books by entering values in any combination of author, title and ISBN.	1	Should have
A user can view detailed information on a book. For example, number of pages, publication date and a brief description.	1	Could have
A user can put books into a "shopping cart" and buy them when they are done shopping.	1	Won't have
A user can remove books from their cart before completing an order.	½	
To buy a book the user enters their billing address, the shipping address and credit card information.	2	
A user can rate books from 1 (bad) to 5 (good). the book does not have to be one the user bought from us.	2	
A user can write a review of a book. They can preview the review before submitting it. The book does not have to be one the user bought from us.	5	
An administrator needs to approve or reject reviews before they are available on the site.	2	

Example

User stories

54

A user can establish an account that remembers shipping and billing information.	2	Must have
A user can edit the credit card information stored in their account.	½	Should have
A user can edit the shipping and billing addresses stored in their account.	1	Should have
A user can put books into a "wish list" that is visible to other site visitors.	2	Could have
A user, especially a Non-Sailing Gift Buyer, can search for a wish list based on its owner's name and state.	1	Won't have
A user can check the status of their recent orders.	½	Could have
If an order has not shipped, a user can add or remove books, change the shipping method, the delivery address and the credit card.	1	Won't have
A user can place an item from a wish list (even someone else's) into their shopping cart.	½	Could have
A repeat customer must be able to find one book and complete an order in less than 90 seconds.	0	Won't have

Example

User stories

55

A user can view a history of all of their past orders.	1	Must have
A user can easily re-purchase items when viewing past orders.	½	Should have
The site always tells a shopper what the last 3 (?) items they viewed are and provides links back to them (this works even between sessions).	1	Could have
A user can see what books we recommend on a variety of topics.	3	Won't have
A user can choose to have items gift wrapped.	½	
A user can choose to enclose a gift card and can write their own message for the card.	½	
A Report Viewer can see reports of daily purchases broken down by book category, traffic, best- and worst-selling books and so on.	8	
A user must be properly authenticated before viewing reports.	1	
Orders made on the website have to end up in the same order database as telephone orders.	0	

Example

User stories

56

An administrator can add new books to the site.

1

An administrator can delete a book.

½

An administrator can edit the information about an existing book.

1

The system must support peak usage of up to 50 concurrent users.

0

Must have

Should have

Could have

Won't have

Example

Release plan for velocity=8

57

ITERATION 1	ITERATION 2
A user can do a basic simple search that searches for a word or phrase in both the author and title fields. (1)	An administrator can edit the information about an existing books. (1)
A user can put books into a "shopping cart" and buy them when they are done shopping. (1)	A user can search for books by entering values in any combination of author, title and ISBN. (1)
A user can remove books from their cart before completing an order. (½)	A user can edit the credit card information stored in their account. (½)
To buy a book the user enters their billing address, the shipping address and credit card information. (2)	A user can edit the shipping and billing addresses stored in their account. (1)
Orders made on the website have to end up in the same order database as telephone orders. (0)	A user can see what books we recommend on a variety of topics. (3)
A user can establish an account that remembers shipping and billing information. (2)	
An administrator can add new books to the site. (1)	
An administrator can delete a book. (½)	
The system must support peak usage of up to 50 concurrent users. (0)	

Task scheduling

Variables

Task scheduling

Fixed units

60

$$\text{Duration} = \frac{\text{Work}}{\text{Units} \cdot \text{hd}}$$

Duration
Work
Units

10 days
80 hours
1 person (8h/d)

What if we increase the estimation by 20 hours?

Units	1 person
Work	100 hours
Duration	12,5 days

(we need more time to do it)

What if we only have 8 days?

Units	1 person
Duration	8 days
Work	64 hours

(we must do it faster)

Task scheduling

Fixed work

61

$$\text{Duration} = \frac{\text{Work}}{\text{Units} \cdot \text{hd}}$$

Duration	10 days
Work	80 hours
Units	1 person (8h/d)

What if we only have 8 days?

Work	80 hours
Duration	8 days
Units	1,25 people

(we include more people)

What if we have one additional developer?

Work	80 hours
Units	2 people
Duration	5 days

(we finish earlier)

Task scheduling

Fixed duration

62

$$\text{Duration} = \frac{\text{Work}}{\text{Units} \cdot \text{hd}}$$

Duration	10 days
Work	80 hours
Units	1 person (8h/d)

What if we increase the estimation by 20 hours?

Duration	10 days
Work	100 hours
Units	1,25 people

(we need more people)

What if we have one additional developer?

Duration	10 days
Work	80 hours
Units	2 people working 50%

(we can work more relaxed)
